

Practice S02P01: Speed of Sound

http://www.comp.nus.edu.sg/~cs1010/4_misc/practice.html

Reference: Unit 4

Week of release: Week 3

Objectives: Writing function, using math function

Task statement:

Write a program **speedOfSound.c** that calculates the speed of sound s in air of a given temperature T (in degree Fahrenheit). Formula to compute the speed s in feet/sec:

$$s = 1086 \sqrt{\frac{5T + 297}{247}}$$

All values are of type float.

Your program should contain a function **speed_of_sound()** to compute and return the speed. You are to decide on its parameter(s).

Sample run:

Temperature in degree Fahrenheit: **95.8**

Speed of sound in air of 95.80 degree = 1924.92 ft/sec
